

**Hydrant Flushing begins on May 13th @ 11:00 pm through 7:00 am
and should conclude by May 21.**

Twice a year the utility department flushes hydrants. Over time, natural minerals will settle in the water mains allowing sediment to accumulate. Flushing is the best preventative action that can be taken to eliminate this. During flushing, the operator can also observe the operation of the hydrant so that any needed maintenance can be scheduled. During flushing, water may become discolored or low pressure may be encountered, which is why we perform this at night. We appreciate your patience while we carry out this important work which helps to ensure that we provide the highest quality water to all residents.

Thank you,

Milltown Utility Department
